

DIRECT REAR VELOCITY SYSTEM (DRVS)

A unique drive motor system designed to enhance the user's workout and offer worry-free operation and maintenance. A rear-drive motor system runs cooler, cleaner and quieter, reduces belt wear and requires less maintenance.

Safe Entry/Exit of equipment: The rear drive motor hood serves as a convenient step for safer, easier entry and exit from a stationary surface.

Less Stress = Less Maintenance: DRVS pulls the belt for direct, consistent tension and less stress on bearings and rollers.

Smooth, Consistent Performance from an efficient, long-life motor. Vector motor controller provides direct feedback to automatically adjust the motor every time the user's foot strikes the deck.

Easy to maintain: Convenient access for maintenance - No need to move cumbersome equipment to access the motor hood.

More room to move: Because the hood is in the back, individuals can make longer, more comfortable strides because of the more usable running space.
